**Study Status**

Recruiting

**Brief Summary of Protocol**

The purpose of the study is to see if kidney donation that occurred 10 to 20 years ago lead to long-term complication such as hypertension, renal failure, protein in the urine, etc.... in obese donors, compared to non-obese donors.

Approximately 40 patients (20 obese and 20 non-obese) will participate, males and females from 21 to 75 years old.

This is a chart-review study, there are no procedures associated with this study. Investigators will look at demographic information, medical and medication history.

**Potential Benefits**

There may or may not be direct benefits to participants. However new information may be collected that may benefit obese kidney donors in the future.

**IRB Information**

Weill Cornell Medical Center IRB  
407 East 61<sup>st</sup> Street, RR-110  
New York, NY 10065  
WCMC IRB #0906010453

**Sponsor Information**

None: investigator-initiated study
